GUIDE TO GENERAL BRAKE PROBLEMS

PROBLEM		PROBABLE CAUSE	CORRECTIVE ACTION
LOW/SPONGY PEDAL 	Pedal nearly touches floorboard before brakes function. No brake reserve.	No fluid in master cylinder. Excessive free play in brake pedal linkage. Pad "knock-back". Excessive clearance between linings and drums. Contaminated fluid. Air in hydraulic system.	Check system for fluid leak and repair. Adjust for proper linkage. Examine rotor run out and parallelism, bearing adjustment, etc. Adjust brakes. Replace with approved brake fluid. Bleed brake system.
HIGH PEDAL FORCE 	Excessive stopping distance, excessive pedal effort, brakes do not react properly.	Worn pads or linings. Frozen calipers or wheel cylinders. Drums worn too thin thus excessive heat expansion.	Replace with new pads or linings. Free up and replace if necessary. Replace with new drums.
BRAKE DRAG 	Sticking brakes may be failing to release properly.	Brakes adjusted too tight. Master cylinder by-pass port blocked. Weak pedal return spring. Distorted backing plates. Sticky wheel cylinder.	Readjust and allow sufficient clearance between lining and drum. Clear blockage. Install new springs. Replace with new plates. Repair with new cups.
BRAKE PULL 	Car pulls to one side when brakes are applied.	Contamination of pads or linings with brake fluid, oil, grease, etc. Unmatched pads or linings. Faulty caliper pad alignment. Unequal brake adjustment. Seized Caliper.	Clean or replace pads or linings. Replace with correct parts. Check for loose caliper mounting bolts, guide pins, broken clips. Readjust all brakes. Overhaul both calipers (ie, pin and seal kits) on that axle.

GUIDE TO GENERAL BRAKE PROBLEMS

PROBLEM		PROBABLE CAUSE	CORRECTIVE ACTION
BRAKE GRAB 	<p>"Touchy" brakes that grab with least pressure.</p>	<p>Contamination of pads or linings with brake fluid, oil, grease, etc.</p> <p>Caliper not aligned with disc.</p> <p>Mounting bolts loose.</p> <p>Brake lines, hoses kinked, collapsed or clogged.</p> <p>Caliper pistons or slides seized.</p>	<p>Clean or replace pads or linings.</p> <p>Correct alignment.</p> <p>Tighten to specified torque.</p> <p>Repair or replace.</p> <p>Free up and replace if damaged.</p>
BRAKE NOISE 	<p>Brakes should operate with minimal amount of noise. However excessive squeal, screech, groaning, grinding chatter or rattle means your brakes need attention.</p>	<p>Too much lateral run out of rotor.</p> <p>Worn pads or linings.</p> <p>Twisted brake shoe.</p> <p>Weak or broken spring components.</p> <p>Drums out of round.</p> <p>Loose wheel bearing.</p> <p>Foreign particles embedded in material.</p> <p>Faulty caliper alignment.</p>	<p>Regrind rotors.</p> <p>Replace with new pads or linings.</p> <p>Replace brake shoes.</p> <p>Replace with new springs.</p> <p>Turn or replace drums.</p> <p>Adjust or replace faulty parts.</p> <p>Replace with new pads or linings.</p> <p>Readjust.</p>
VIBRATION 	<p>Brake pedal, steering wheel or entire wheel shakes, vibrates or pulsates when brake is applied.</p>	<p>Rotor run out and parallelism.</p> <p>Wear in steering and suspension components.</p> <p>Wheels out of balance.</p>	<p>Resurface disc brake rotors.</p> <p>Examine and replace worn components.</p> <p>Wheel balance required.</p>
BRAKE WEAR 	<p>Premature wear can be caused by a number of faults in the brake system. To avoid costly repairs have the brakes checked at least once a year.</p>	<p>Wrong type of pad or lining material for operating conditions.</p> <p>Caliper pistons and/or pins seized.</p> <p>Extremely rough rotor surface.</p>	<p>Replace with correct pad or lining material for application.</p> <p>Fit pin and seal kits.</p> <p>Regrind rotors.</p>

A technical line drawing of a brake shoe assembly. The drawing shows two curved brake shoes, one positioned above the other, with various mounting points, pins, and springs. A horizontal rectangular bar is superimposed over the center of the drawing, containing the text 'BRAKE SHOE ASSEMBLY' in bold, black, uppercase letters.
